

ChatGPT Prompts for Career Roadmap Project

1. I am building a Career Roadmap Generator web application using HTML, CSS, Bootstrap, JavaScript, Flask, and a database. Can you explain the complete flow step-by-step from user selecting a career, clicking a button, frontend sending request, backend generating roadmap using API, storing it in database, and finally displaying it on the frontend in a simple way?
2. In my project, I have a button in HTML for 'Generate Roadmap'. I want to understand how JavaScript connects this button click to a Flask backend API using fetch(), how data is sent (JSON format), and how the response is received and shown on the webpage without refreshing. Can you explain this clearly with a simple example?
3. I am creating a feature where a career roadmap is generated using an API and stored in a database so that it is not generated again every time. Can you explain how the backend should check the database first, when to call the API, and how to store and reuse the roadmap data in a simple logic flow?
4. In my project, when a user clicks on a roadmap topic, I want to display subtopics dynamically using JavaScript and backend API. Also, I want to update a Bootstrap progress bar based on completed topics. Can you explain how this interaction between frontend click, backend response, and UI update should work step-by-step?
